Signaling pathways

Falk Hüffner (Univ. Jena)

solated Clique enumeration

Signaling pathways

Signaling pathways

Definition

A signaling pathway is a cascade of successive protein interactions that the cell uses to react to stimuli.

Definition

A linear signaling pathway contains each protein only once.

Graph model

Protein interaction network:

- Proteins are nodes
- Interactions are undirected edges
- Edges are annotated with interaction probability (obtained e.g. by two-hybrid screening)

Definition

A linear signaling pathway is a sequence of distinct proteins, where each interacts strongly with the previous one.

Graph model

Protein interaction network:

- Proteins are nodes
- Interactions are undirected edges
- Edges are annotated with interaction probability (obtained e.g. by two-hybrid screening)

Definition

A linear signaling pathway is a sequence of distinct proteins, where each interacts strongly with the previous one.

MOST PROBABLE PATH [SCOTT et al., J. Comp. Biol. 2006]

Input: Graph G = (V, E), interaction probabilities $p : E \to [0, 1]$, integer k > 0. **Task:** Find a non-overlapping path v_1, \ldots, v_k of length k in G that maximizes $p(v_1, v_2) \cdot \ldots \cdot p(v_{k-1}, v_k)$.

Graph model

MOST PROBABLE PATH [SCOTT et al., J. Comp. Biol. 2006]

Input: Graph G = (V, E), interaction probabilities $p : E \to [0, 1]$, integer k > 0. Task: Find a non-overlapping path v_1, \ldots, v_k of length k in G that maximizes $p(v_1, v_2) \cdot \ldots \cdot p(v_{k-1}, v_k)$.

Signaling pathways

Balanced subsystems

Isolated Clique enumeration

Minimum-Weight Path

Theorem

MINIMUM-WEIGHT PATH is NP-hard [Garey & Johnson 1979].

Idea

Exploit the fact that the paths sought for are rather short (\approx 5–15): restrict the exponential part of the runtime to k (parameterized complexity).

(4 伊下 4 戸下 4 戸下

Isolated Clique enumeration

Fixed-parameter tractability

Parameterized complexity is an approach to finding exact solutions to NP-hard problems by confining the combinatorial explosion to a parameter.

- 4 同 1 - 4 回 1 - 4 回 1

solated Clique enumeration

Fixed-parameter tractability

Parameterized complexity is an approach to finding exact solutions to NP-hard problems by confining the combinatorial explosion to a parameter.

Definition

A problem is called fixed-parameter tractable with respect to a parameter k if an instance of size n can be solved in $f(k) \cdot n^{O(1)}$ time for an arbitrary function f.

|田田 |田田 |田田

Color-coding

Color-coding is a method for solving $\rm MINIMUM\text{-}WEIGHT$ $\rm PATH$ that is fast for short path lengths.

Color-coding [Alon, Yuster & Zwick, J. ACM 1995]

- randomly color each vertex of the graph with one of k colors
- hope that all vertices in the subgraph searched for obtain different colors (colorful)
- solve the MINIMUM-WEIGHT PATH under this assumption (which is much quicker)
- repeat these trial until it is reasonably certain that the path was colorful at least once

Result: exponential part of the runtime depends only on k

イロト 不得下 イヨト イヨト

Isolated Clique enumeration

Dynamic programming for Minimum-Weight Colorful Path

Idea

Table entry W[v, C] stores the minimum-weight path that ends in v and uses exactly the colors in C.

Isolated Clique enumeration

Dynamic programming for Minimum-Weight Colorful Path

Idea

Table entry W[v, C] stores the minimum-weight path that ends in v and uses exactly the colors in C.

 $W[B, \{ \bigcirc, \bigcirc, \bigcirc \}] = 4$

・ 何 ト ・ ヨ ト ・ ヨ ト

Isolated Clique enumeration

Dynamic programming for Minimum-Weight Colorful Path

Coloring $c: V \rightarrow \{1, \ldots, k\}$

Recurrence

$$W[v, C] = \min_{u \in N(v)} (W[u, C \setminus \{c(v)\}] + w(u, v))$$

< 17 ▶

프 문 문 프 문

Isolated Clique enumeration

Dynamic programming for Minimum-Weight Colorful Path

Coloring $c: V \rightarrow \{1, \ldots, k\}$

Recurrence

$$W[v, C] = \min_{u \in N(v)} (W[u, C \setminus \{c(v)\}] + w(u, v))$$

- Each table entry can be calculated in O(n) time
- $n \cdot 2^k$ table entries

 \rightsquigarrow Running time per trial: $O(2^k \cdot n^2)$

不同 トイモト イモト

Color-coding running time

- $O(2^k \cdot n^2)$ time per trial
- To obtain error probability ε , one needs $O(-\ln \varepsilon \cdot e^k)$ trials

Theorem ([ALON et al., JACM 1995])

MINIMUM-WEIGHT PATH can be solved in $O(-\ln \varepsilon \cdot 5.44^k |G|)$ time.

Balanced Subgraph

Definition (BALANCED SUBGRAPH)

Input: A graph with edges labeled by = or \neq . **Task:** Find a minimum set of edges to delete such that the graph becomes balanced.

Falk Hüffner (Univ. Jena)

Applications of Balanced Subgraph

- "Monotone subsystems" in gene regulatory networks [DasGupta et al., WEA 2006]
- Balance in social networks

[HARARY, Mich. Math. J. 1953]

e.g. Harary: A structural analysis of the situation in the Middle East in 1956, J. Conflict Resolution 1961

- Minimum energy state of magnetic materials (spin glasses) [KASTELEYN, J. Math. Phys. 1963]
- Stability of fullerenes

[Došlić & Vukičević, Discr. Appl. Math. 2007]

Integrated circuit design

[CHIANG et al., IEEE Trans. CAD of IC & Sys. 2007]

- 4 個 ト 4 ヨ ト 4 ヨ ト

Balanced Subgraph: known results

- BALANCED SUBGRAPH is NP-hard, since it is a generalization of MAX-CUT (MAX-CUT is the special case where all edges are ≠)
- A solution that keeps at least 87.8 % of the edges can be found in polynomial time

[Thagard & Verbeurgt, Cogn. Sci. 1998]

• A solution that deletes at most *c* times the edges that need to be deleted can probably not be found in polynomial time [KHOT, STOC 2002]

Isolated Clique enumeration

Fixed-parameter tractability

Theorem

BALANCED SUBGRAPH can be solved in $O(2^k \cdot m)$ time by a reduction to EDGE BIPARTIZATION and using an algorithm based on iterative compression [Guo et al. 2006].

A heuristic speedup trick can give large speedups over this worst-case running time.

Experimental results

			Approximation			Exact alg.	
Data set	n	т	$k \ge$	$k \leq$	t [min]	k	t [min]
EGFR	330	855	196	219	7	210	108
Yeast	690	1082	0	43	77	41	1
Macr.	678	1582	218	383	44	374	1

• Yeast is not solvable without reducing 4-cuts

• A real-world network with 688 vertices and 2208 edges could not be solved

イロト 不得下 イヨト イヨト

- Directed case of BALANCED SUBGRAPH (delete minimum number of edges to remove all unbalanced cycles): FPT?
 - Problem: Characterization by two-coloring does not work
- The data reduction scheme is applicable to all graph problems where a coloring or a subset of the vertices is sought. For example:
 - VERTEX COVER
 - Dominating Set
 - 3-Coloring
 - Feedback Vertex Set

but: need small cuts (e.g., small-world networks)

Clique Enumeration

Application

- Analysis of biological, social, and other networks
- Finding complexes in protein interaction networks
- Clustering in data mining

Maximal clique enumeration

- Simple model
- NP-hard
- up to $3^{n/3}$ cliques

Isolated cliques

- More specific model
- More efficient enumeration algorithms (FPT)

c-Isolation

Definition (Ito, Iwama & Osumi, ESA 2005)

A vertex set S is called c-isolated if on average the vertices in S have less than c neighbors outside of S.

Example: 2-isolation

- 4 同 1 - 4 回 1 - 4 回 1

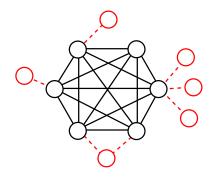

Isolated Clique enumeration

c-Isolation

Definition (Ito, Iwama & Osumi, ESA 2005)

A vertex set S is called c-isolated if on average the vertices in S have less than c neighbors outside of S.

Example: 2-isolation

Isolated Clique enumeration

Enumerating maximal *c*-isolated cliques

Theorem

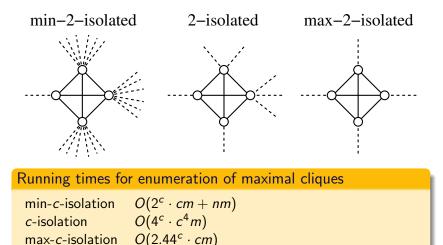

All maximal c-isolated cliques in a graph G can be enumerated in $O(2.89^c \cdot c^2m)$ time.

Finding complexes: Experimental setup

Question

Are isolated cliques a good model for complexes?

Experiment

- We retrieved a protein interaction network from BioGRID: *S. cerevisiae*: 5195 nodes, 70911 edges.
- We retrieved annotation data for each protein from the Saccharomyces Genome Database (SGD).
- For each enumerated clique, we calculated the *p*-values for the enrichment of annotation terms with the GO Termfinder software, and chose the annotation term with the lowest *p*-value.

Balanced subsystems

Isolated Clique enumeration

Finding complexes: Experimental results

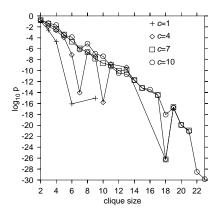

General observations

- running time: few seconds
- maximal isolated cliques show more significant enrichment of annotation terms than maximal cliques

- 4 同 1 - 4 回 1 - 4 回 1

Isolated Clique enumeration

Finding complexes: Experimental results

Comparison of mean p-values of the enumerated maximal min-c-isolated cliques and different values of c.
